

C Programming - Assignment 03

1. Write a function to implement four function calculator. Function would take operands and operator as arguments and returns result.
2. In above program, division may fail if denominator is zero. Use global variable as an error flag to avoid this problem.
3. Write a function to calculate sum and product into a single function and print result in calling function. (Do not use global variables for result)
4. Write a function to perform division of two numbers. Return result via out parameter and return value indicates the error (due to zero denominator).
